

Classically, a 50/50 beamsplitter splits the intensity of an incoming beam in two. Quantum-mechanically, it will not split each photon in two, but it will transmit or reflect each photon with 50% probability (see ...

Quick-reference guide for beam splitters -- key equations, type comparison tables, Fresnel reflectance, polarizing designs, and a practical selection workflow. Condensed from the comprehensive guide.

These thin beam splitters can be inserted into an optical light path without beam shift or chromatic dispersion for any light transmission application. Chrome plate half mirrors are plate beamsplitters ...

Optical components that create two beams by splitting incident light are beamsplitters. Read more about the different types of beamsplitters at Edmund Optics.

Beamsplitters are used in laser systems, optical interferometry, fluorescence, and biomedical instrumentation. They come in three basic forms: plate, pellicle, and cube. All are made using a ...

Our beam splitters are made from high grade glass material with laser grade surface flatness & surface quality for tighter tolerance on the splitting ratio.

The diffractive beam splitter is used with monochromatic light such as a laser beam, and is designed for a specific wavelength and angle of separation between output beams.

This beam splitters buying guide provides technical background, comparison of major types, selection criteria, and an overview of suppliers.

Large beam size, multi mirror optical set up with small power light source and supports high power laser light splitting. Polarization at 45 degree (AOI) or circle polarization light with no power loss detected. ...

Thorlabs offers a wide range of optical beamsplitters. Our plate beamsplitters have a coated front surface that determines the beam splitting ratio while the back surface is wedged and AR coated in ...
