The effects of changing the Raman length on gain is investigated for the proposed amplifiers and the optimized length for Raman fiber is determined for obtaining large gain with minimum ripple.

The Raman amplifier is a distributed amplifier. It can be used at both the transmit end (for forward amplification) and the receive end (for backward amplification).

The Raman amplifier makes use of stimulated Raman scattering (SRS) within the fiber, which transfers the energy of higher-frequency pump signals to lower-frequency signals.

Raman amplifiers distribute gain along the entire fiber length, improving OSNR. The operation is based on stimulated Raman scattering (SRS). High-power pump light (1-2 W at multiple ...

Shows the automatic optimization of a 12-pump Raman amplifier to give 0.2 dB ripple over an 80-nm bandwidth (1527 nm-1607 nm). The optimization can be performed for uni- and bi-directional pumping.
