When configuring access switches to be managed by the controller, you can use the core switch as the management subnet gateway of the access switches, and configure the management VLAN auto ...

By default, the Access Controller has the following IP address: 169.254.1.1. You can manage and configure the AC by Telnet or by opening a web browser, visiting the following URL: ...

Switches must first change from the traditional management mode to cloud-based management mode, and then obtain the cloud management platform's URL/IP address and port number.

In the cloud-based management mode, the user name and password configured through serial ports, SSH, HTTP, or app are valid only before an AP registers with the SDN controller.

Most Huawei APs can switch between different modes. Only a few APs support only one mode, and therefore do not support mode switching. An AP may support different modes in different versions.

The document provides configuration instructions and commands for basic switch configuration using Huawei switches. It covers topics such as changing the hostname, configuring user accounts and ...

The text covers tasks such as creating a user, VLAN configuration, port settings, enabling SSH and Telnet services, configuring Spanning Tree Protocol (STP), and other basic management operations ...

To manage a switch, you need to use its management interface and management IP address. This document describes the management interfaces supported by switches and how to configure ...
