

When the optical module on an interface is faulty, you can run the following command to view information about the optical module.

Run the `display transceiver diagnosis interface [interface-type interface-number]` command to view diagnostic information about a specified optical module. This command displays the digital diagnostic ...

Display diagnostics data, warnings, and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, or Virtual Chassis port interfaces. Displays diagnostics for optical ...

Based on typical issues encountered with optical modules in daily switch applications, this document summarizes basic troubleshooting steps for resolving common faults:

Once the transceiver and fiber optic cable are plugged in properly in the switch optical module, you should be able to view the current information for the optical connection, which helps ...

Once the transceiver and fiber optic cable are plugged in properly in the switch optical module, the Optical Module Status page of the web-based utility provides the current information for the optical ...

1. Optical Module Status Check Run the following command to view interface information: `display interface <interface-type> <interface-number>`; The output includes interface rate, module type, link ...

In this article, we will focus on teaching you how to troubleshoot and solve the common three categories of optical module failure. First, the transmission class of the optical module fault ...

Additionally, identifying module information helps detect coding compatibility between the module and the switch. The following introduces the specific operations to view the working status ...

See the interface module via the optical display command information, including general information of the optical module, manufacturing information, and alarm information.
