

Punching process in cable tray production

A standard fully automatic cable tray roll forming line mainly includes the following steps: Decoiling, Leveling, Servo Feeding, Punching, Roll Forming, Length Cutting and Automatic Stacking

2. Scope This SOP applies to all production staff, supervisors, and quality inspectors involved in cutting, punching, forming, welding, surface finishing, inspection, and ...

Cable tray manufacturing relies on a coordinated production line of specialized machines: a roll forming line shapes the profile, a CNC press brake handles secondary bending, a punch press ...

The lines we propose allow industrialising any type of cable tray. Our lines are suitable to manufacture cable trays, in different widths, heights, and thicknesses, at a high rate, with low changeover times.

Hydraulic or servo punching systems can be integrated with the roll forming process to achieve synchronized production. Accurate punching improves installation convenience and reduces ...

Punching stations can be configured to produce various hole patterns depending on end-use specifications. This table summarizes the key differences between cable tray profile families and ...

These machines are designed to punch holes, slots, or perforations in cable tray components with precision and speed, optimizing your manufacturing capabilities.

Utilizing advanced automation technology combined with precise punching, bending, and cutting processes, this machine efficiently completes the forming and processing of cable trays, meeting the ...

EN: The video demonstrates the operation of an automated production line for metal profile manufacturing. The system performs continuous punching and forming of sheet metal from a coil.

Our production line is equipped with intelligent punching, roll forming and synchronous cutting modules, which can flexibly adapt to different specifications and support customized production with a width of ...
